ACKNOWLEDGMENTS:

In performing our assignment, we had to take the help and guideline of some respected persons, who deserve our greatest gratitude. The completion of this assignment gives us much Pleasure. We would like to show our gratitude Ms. Manu Bali for giving us a good guideline for assignment throughout numerous consultations. We would also like to expand our deepest gratitude to all those who have directly and indirectly guided us in writing this assignment. Many people, especial our team members itself, have made valuable comment suggestions on this proposal which gave us an inspiration to improve our assignment. We thank all the people for their help directly and indirectly to complete our assignment.

INTRODUCTION:

This is a small project to design a website on the Saloon management system.

The basic idea is that customer can aware about the different hair styles and they can have demo vision for to maintain beauty . Customer can also pay their money through online banking facility, and they also book their appointment according to their daily busy schedule in their life.

Saloon management system is also an one of the useful website according to this fast generation. Now-a-days this is a fully equipped system that alone manages the entire functioning of a hair saloon and beauty saloon too. The system is even equipped to manage customer billing and data storage.

PROJECT DESCRIPTION:

This project is basically based on **HTML**, **CSS** and a bit of **java script** and **j-query**. In this project there is **six** section

First part contains Login and register form..

Second part contains the **navigational bar** for home,aboutus etc.

Third part contains Booking appointment form .

Fourth part contains about showing our services

Fifth part contain direct links for social link in the form of icons.

Sixth part contains the mail to send any further ideas to increase our website.

Seventh part contains contact info and with specified E-mail address.

Eight part contains location part with the help of visibility of map.

Nineth part contains scroll option view for facials,makeup and nails with direct specified links.

CONCEPT USED:

TAG NAME AND DESCRIPTION:

HEADER:

The header of the website is the consistent area at the top of site that include the logo and navigation menu

A header might include:

- Logo
- Navigation menu
- Phone number
- Address
- Search box
- Login or my account link

<!DOCTYPE>:

This is the document type tag, which is actually not a tag, but a declaration of the version of HTML that is used. It is to help the browser understand the version and type of web page, without which the browser would not be able to even recognize the webpage. The document type tag does not have an end tag.

<a>:

The anchor tag, as this tag is called, interconnects two pages (unidirectional) with the help of a page address. The link of the interconnected page needs to be inserted as part of the href attribute, which makes the text accessible, and directs you to the said page on clicking the linked text.

:

The bold tag is used, as the name suggests, to make text bold, or stand out from other text on a webpage. Similar to the bold effect found in most word processing programs.

<body>:

The body tag displays all the content of an HTML document, such as text, hyperlinks, images, tables, lists, etc.

**
:**

This tag lets you add a line break to the text. It puts anything that comes after it on a new line. The line break tag is an empty tag, meaning it has no end tag.

<button>:

The button tag defines a clickable button. Inside this tag you can put content, like text or images.

<center>:

The center tag is used to align elements or text to the center of the page. This tag is not supported in HTML 5, CSS properties need to be used instead.

<form>:

The form tag is one of the most important aspects of interactive pages. It is used to create an HTML form for user input.

:

This tag is similar to the basefont tag, except it applies the font style to the content and elements within the tag, and not across the whole page. The font tag is not supported in HTML 5, CSS is used instead.

<head>:

As the name states, the head tag is mainly responsible for the functioning of the body. The head tag includes all the script and style elements, and must include a title for the document

<header>:

The header tag specifies a header for a document or section. The header element should be used as a container for introductory content or a set of navigational links.

<h1> to <h6> :

The h1 to h6 tags are used to define HTML headings. They add highlight and font style to let the heading of the section stand out. h1 defines the most important heading, while h6 defines the least important.

<input>:

As the name suggests, an author can accept inputs from users making a page interactive, using this tag. It is used within the form tag.

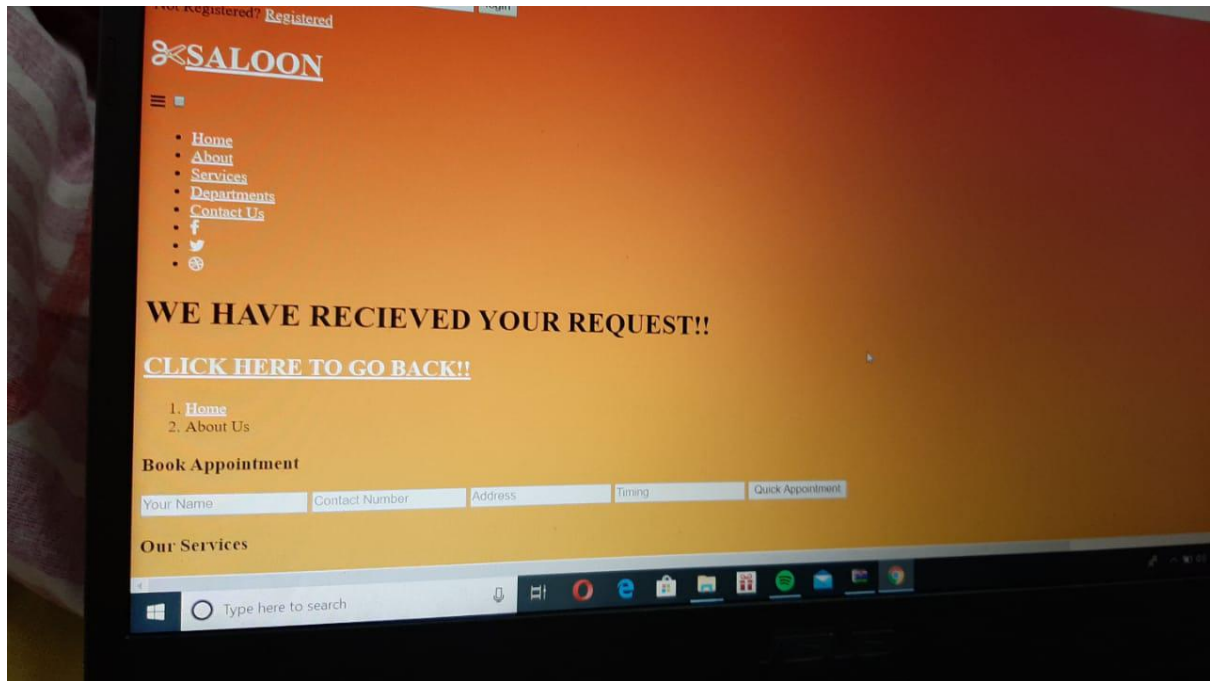

<p>:

The p tag defines a paragraph on the page.

<script>:

The script tag enables the author to insert scripting language into document, such as JavaScript. This tag lets you validate, manipulate, and affect content dynamically.

WEBSITE SCREENSHOTS

TEAM WORK:

BY

B.Mahesh babu:

I design the all the fronted page like adding logo add all the button and use java script to call the function to perform any action like for login page register page. I also designed navigational bar and displayed images using marquee tag.

N.Sai Teja:

I change the color and give the location of content using css. I used list tags to make important links and faqs.

Deepanshu Singla:

Firstly I learnt all the required concept to develops a website. I have designed the footer part ie the saloon system part and disclaimer part.
